

AWS IAM

Identity and Access Management

David Krohn, AWS DevOps Engineer

AWS Identity and Access Management

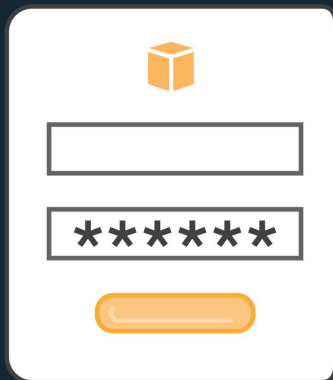

- IAM Essentials
- IAM Root
- IAM Users
 - IAM Groups
- IAM API Keys
- IAM Policies
- IAM Roles
- IAM Temporary Credentials
- IAM Federated Access

Identity and Access Management Means ...

AUTHENTICATION

Validate identities securely.

AUTHORIZATION

Manage access using fine-grained policies.

AUDIT / GOVERNANCE

Meet compliance requirements.

IAM Essentials

- IAM provides access and access permissions to AWS resources
- IAM is global to all AWS regions
- Manage:
 - Users, Groups, Roles, Policies, API Keys
- Non-explicit deny rule set:
 - New created IAM Users have no access to any AWS Services

IAM Root

Account Owner ID (Root Account)

- Access to all subscribed services
- Access to billing
- Access to console and APIs
- Access to Customer Support

IAM Root

DO NOT USE ROOT FOR DAILY WORK

TASKS THAT REQUIRE ROOT CREDENTIALS

IAM Users

- Identified by an ARN
- Permissions
 - Attached or inline permissions
- Security credentials
 - Sign-in credentials
 - Access Key
 - SSH Key

IAM Groups

- Allows to assign IAM permission policies
- Easier access management

IAM API Keys

- Required for programmatic calls to AWS
 - AWS CLI
 - Tools for Windows Powershell
 - AWS SDKs
 - Direct HTTP calls using the AWS service APIs
- API Keys are only available during creation
- Roles does not have API credentials
- In the AWS console you can only see the access key

IAM Policies

- A policy is a document that formally states one or more permissions
- There are two kinds of permissions:
 - Explicit deny: Explicit denies will always override explicit allows
 - Explicit allows: Detailed access rights to AWS services
- IAM policies take effect immediately
- IAM provides prebuilt policy templates

<https://policysim.aws.amazon.com/home/index.jsp>

IAM Policies

- Can be attached to Identities or resources
- Identities are
 - User
 - Groups
 - Roles
- Resources eg.
 - S3 Buckets
 - KMS Key
 - SQS Key

Account ID: 123456789012	
Identity-based policies	Resource-based policies
John Smith Can List, Read On Resource X	Resource X JohnSmith: Can List, Read MaryMajor: Can List, Read
Carlos Salazar Can List, Read On Resource Y,Z	Resource Y CarlosSalazar: Can List, Write ZhangWei: Can List, Read
MaryMajor Can List, Read, Write On Resource X,Y,Z	Resource Z CarlosSalazar: Denied access ZhangWei: Allowed full access
ZhangWei No policy	

IAM Policies - What does an policy look like?

Principal:
Grant permissions to the principal that is specified in the policy.

Resource:
Specify a list of resources to which the actions apply

```
{
  "Version": "2012-10-17",
  "Id": "S3-Account-Permissions",
  "Statement": [{
    "Sid": "1",
    "Effect": "Allow",
    "Principal": {"AWS": ["arn:aws:iam::123456789101:root"]},
    "Action": "s3:*",
    "Resource": [
      "arn:aws:s3:::mybucket",
      "arn:aws:s3:::mybucket/*"
    ]
  }]
}
```

Effect:
Either **Allow** or **Deny**

Action:
service:action

IAM Policies - Identity Policy

User

attached to

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:AttachVolume",
        "ec2:DetachVolume"
      ],
      "Resource": [
        "arn:aws:ec2:*:*:volume/*",
        "arn:aws:ec2:*:*:instance/*"
      ]
    }
  ]
}
```

IAM Policies - Resource Policy

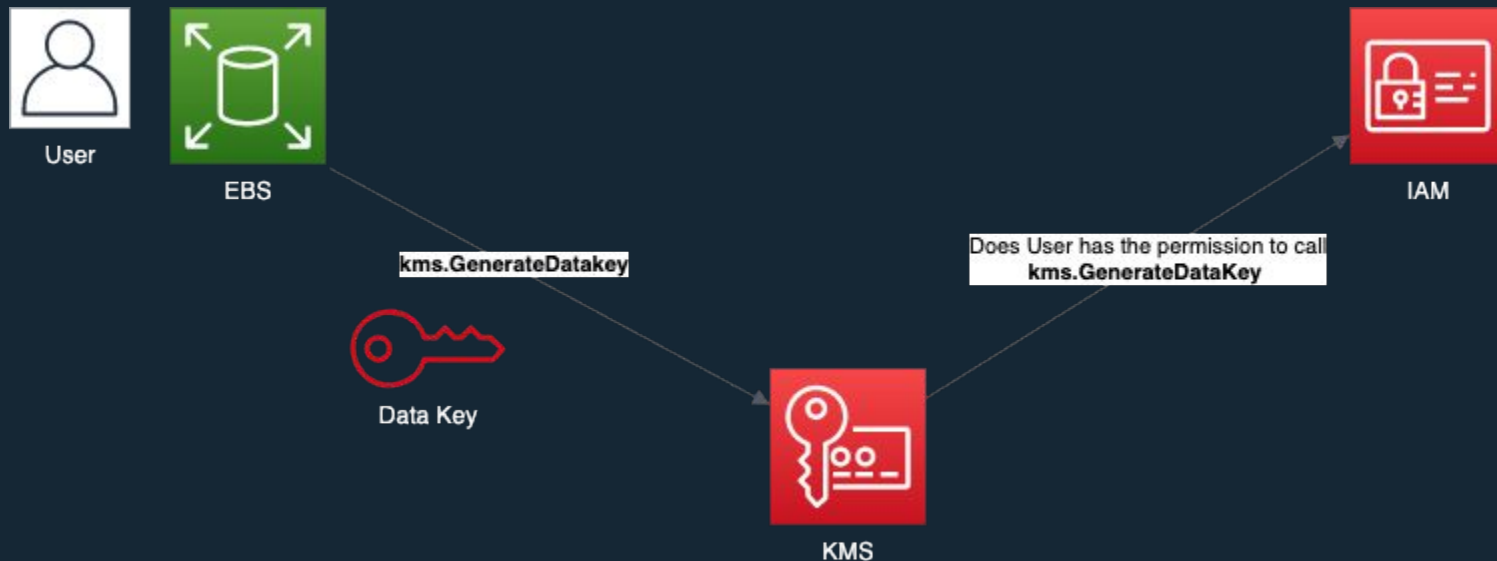

KMS Key

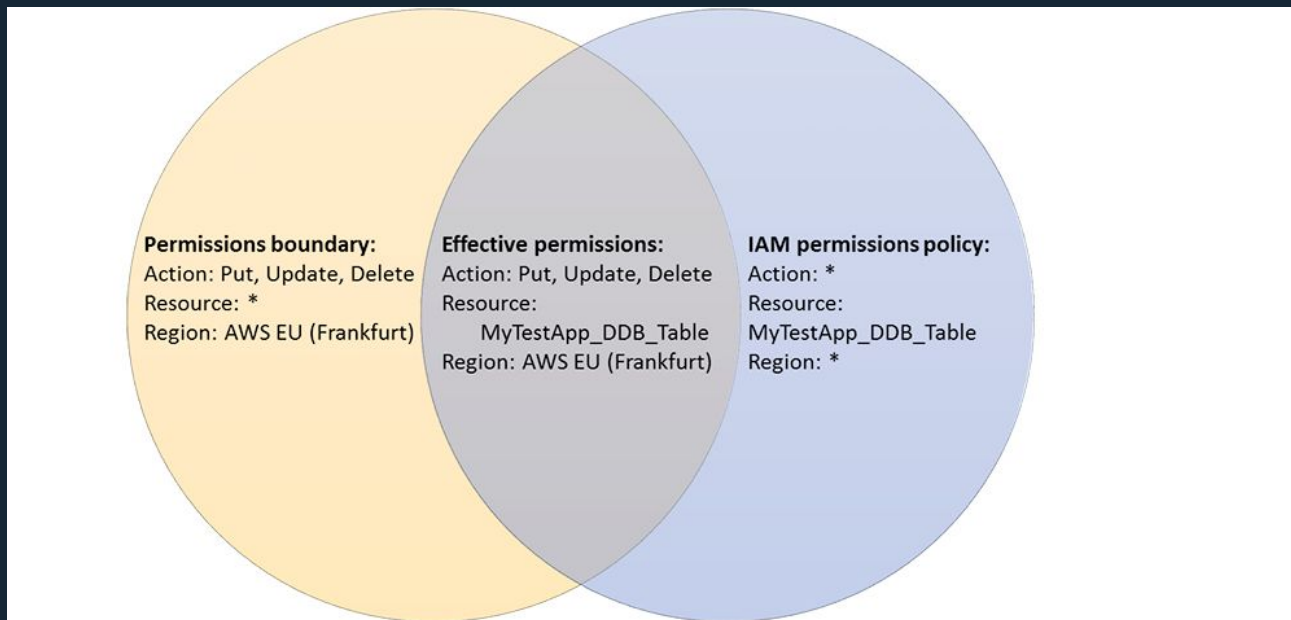

attached to

```
{
  "Sid": "Allow use of the key",
  "Effect": "Allow",
  "Principal": {"AWS": [
    "arn:aws:iam::123456789012:user/CMKUser",
    "arn:aws:iam::123456789012:role/CMKRole",
    "arn:aws:iam::123456789012:root"
  ]},
  "Action": [
    "kms:Encrypt",
    "kms:Decrypt",
    "kms:ReEncrypt*",
    "kms:GenerateDataKey*",
    "kms:DescribeKey"
  ],
  "Resource": "*"
}
```

IAM Policies - example EBS encrypted Volume

IAM Policies - Permission Boundary

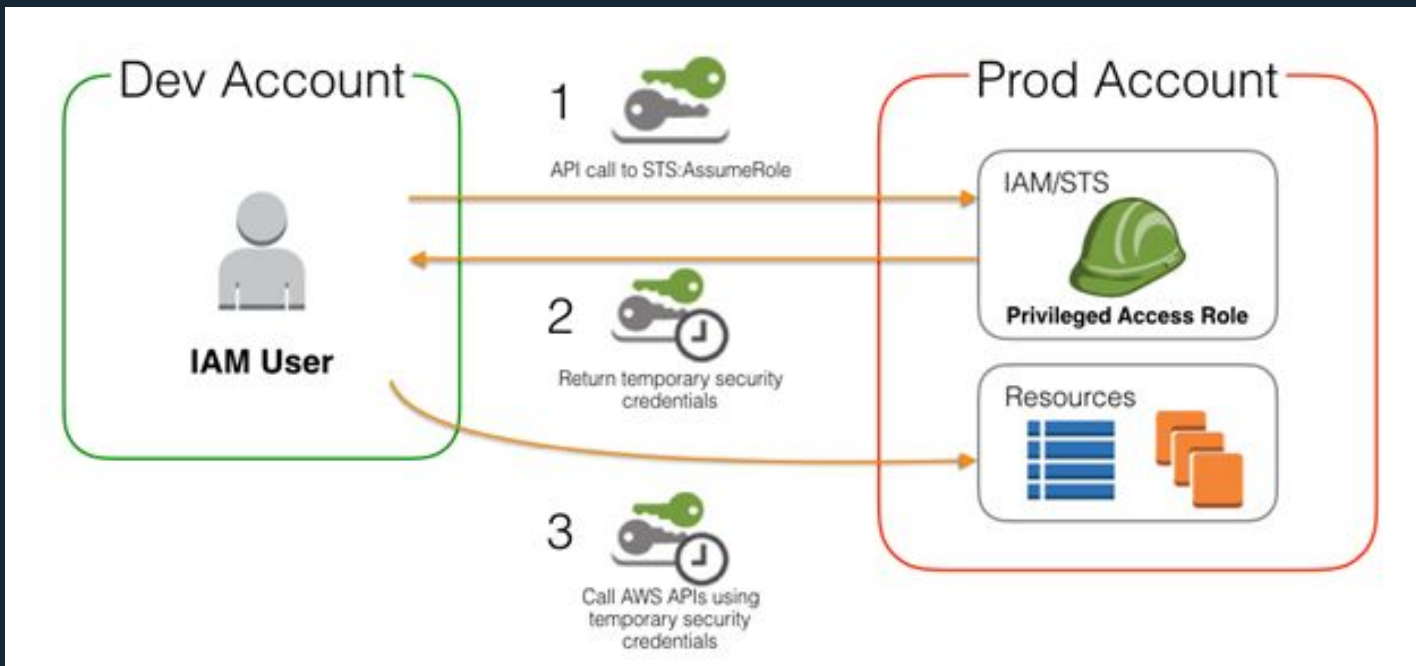

IAM Roles

- Roles allow AWS resources, like EC2, to access other AWS services
- Roles can allow access to AWS services for non AWS account holders like Active Directory
- Roles are the only option to assign permission policies to AWS resources
- An EC2 instance can have only one role attached
- Roles can be assumed by other AWS Accounts

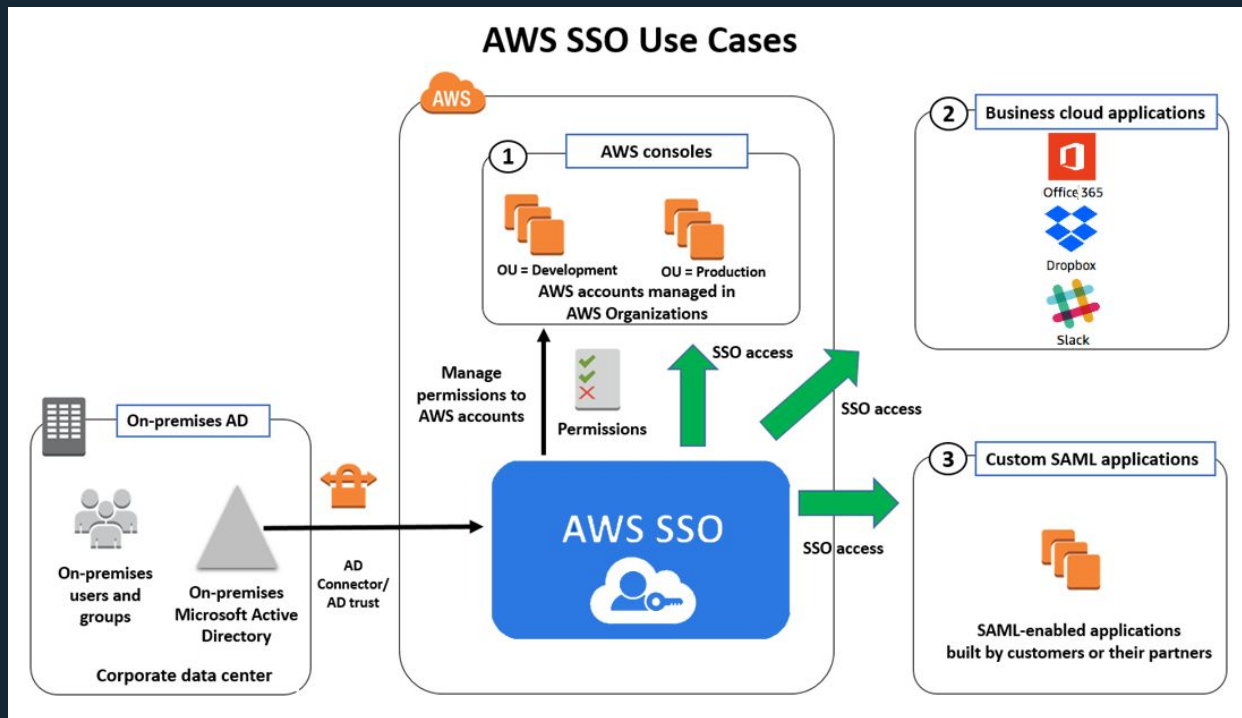

IAM Temporary Credentials

- AWS STS is a service to create and provide temporary security credentials that can control access to your AWS resources
- Advantages:
 - Provide access to resources without need to provide an AWS identity
 - Credentials have a limited lifetime upto 12 hours

IAM Cross Account Roles

IAM Federated Access

IAM Best Practices

- Enable multi-factor authentication (MFA) for privileged users.
- Remove Unnecessary Credentials.
- Use Policy [Conditions](#) for Extra Security.
- Avoid hardcoding credentials in source code.
 - You can use **IAM roles** instead
- Try to use temporary credentials
- Use Groups to Assign Permissions to IAM Users
- Least privileges principle
- Automate everything (CloudFormation or TF or CDK)
 - [do security validation of your templates eg. cfn-nag](#)
